

# IT Security: Don't Bypass the Basics

## Patching

The biggest security risk you have is unpatched computers. Having a reliable patching and updating schedule is crucial for preventing cyber attacks

## Remote Workforce

Employees are working from home more often now; you need to ensure their connections to your network are always secure

## Shine a Light in the Shadows

Make sure employees aren't creating "shadow IT processes" which may be allowing regular security protocols to be circumvented

## Education

One of the best ways to protect your company is to ensure that all employees are trained to know what online behaviors are dangerous and how to avoid unnecessary risk

## Communication

Listening to your employees and making them feel connected is crucial. Having easy and open communication channels is also helpful
